

# EcoArch™

## **EcoArch™ Bottomless Arch Culvert Minimize Environmental Impact**

Protecting our streams and watersheds is important to TrueNorth Steel and we offer a wide range of solutions to providing vehicular and pedestrian passage while minimizing environmental impact. Bottomless culvert arches are available up to 50' span and we can assist with sizing structures and foundations.

EcoArch™ is an environmentally sensitive option for crossing streams and drainages. Streambeds provide shelter and food for spawning fish and other wildlife. Conventional culverts can damage the streambed, creating unwanted obstructions that fragment aquatic ecosystems and harm fish populations and other aquatic species. The EcoArch's™ open-bottomed structure makes it possible to create a crossing over sensitive ecosystems while leaving the natural channel untouched. By eliminating barriers for fish and other aquatic species, the EcoArch™ can also play an important role in restoration and rehabilitation of natural stream bottoms.
